Functional Change

## QuickProof Enhancements

At A Glance:

Proofs created using QuickProof will now honor any changes made to the separation output and order settings of the image component parameter that is made in the high resolution device Imaging function for separations and order settings.
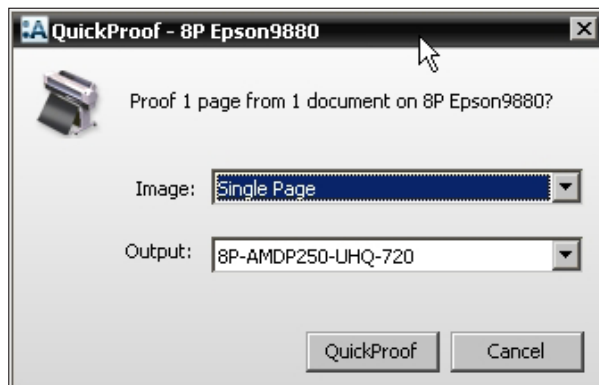

Applies to:

Prepress Automate, Manage, Control

How It Works:

In some jobs you may have a color in your content files but for whatever reason that color is not intended for output. You can disable this color in the image portion of your high res output device.

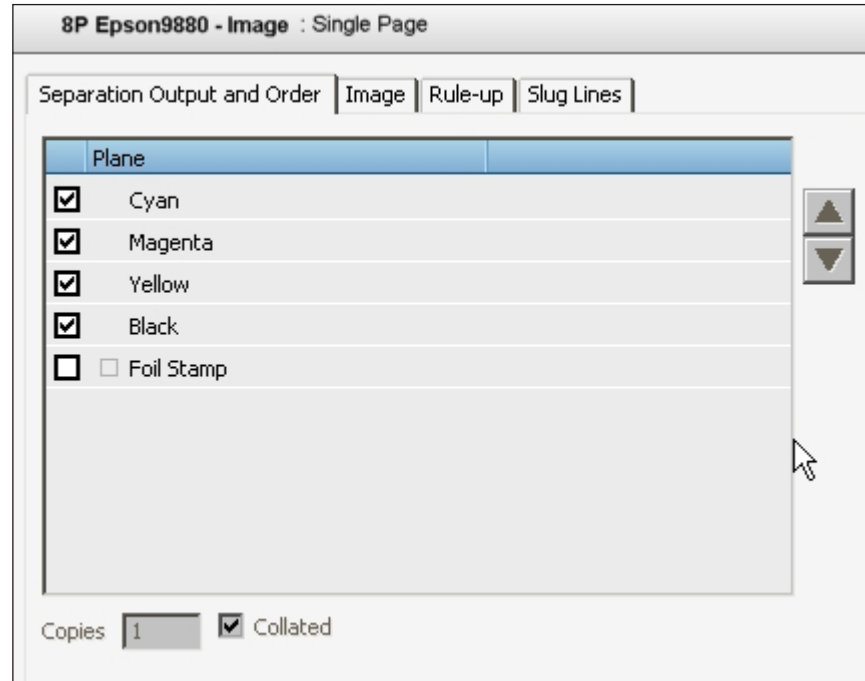

Now, when you perform a QuickProof...

... you'll only get the separations selected in the high resolution flow.

Why is this Important?

Prior to the release of Prepress 7 this setting was never taken in to account. Now your QuickProof will better reflect the final output of your job.
